

Amendments to the Abstract of the Disclosure

Please amend the abstract at page 104 to read as follows.

In a recording apparatus including an inversion unit for inverting a recording sheet recorded on a side in a recording unit by conveying along a predetermined path and returning the recording sheet to the recording unit, the ~~invention reduces~~ possibility of a peeling of a recording material from the recorded surface or a re-deposition of the recording material onto the recording sheet can be reduced. The recording sheet subjected to a recording on a side in the recording unit having a recording head ~~††~~ is conveyed to the inversion unit~~[[.]]~~, ~~The inversion unit~~ which includes, at a recorded side of the recording sheet, a two both-side roller A-108 and a both-side roller B-109 rollers which are driven and are formed by of an elastic ~~member such as rubber or an elastomer material~~, and, at a non-recorded side, a two both-side pinch roller A-113 and a both-side pinch roller B-112 rollers which are formed by of a non-elastic ~~member such as a polymer resin and respectively cooperate with the both-side roller A-108 and the both-side roller B-109, and the~~ material. The inversion unit conveys the recording sheet along a turnaround path with the recorded side inside, thereby inverting and returning the recording sheet to the recording unit.
